

CROATIA / JANUARY 2021 - MAY 2026

# HNB in a crowded inflation debate.

Higher inflation accompanies a smaller institutional share in the primary models. Time controls qualify that finding.

Petra Palić & Luka Sikić / Hrvatsko katoličko sveučilište

## -0.21

percentage points of weighted share  
per +1 percentage point of inflation

**Primary weekly model.** The 95% interval is 0.11 to 0.31 percentage points lower. The full-sample models contain 268 fitted weeks or 60 months. This is a conditional association, not a causal effect.

## An inflation comparison: 2% to 10%

Primary difference: -1.68 pp. Other variables held fixed; all models include media volume.

Points show estimates; lines show 95% intervals. With year effects, the interval includes zero: the association is sensitive to time controls.

## What is being measured?

Inflation relevance selects the items; prominence and potential reach determine their weights. The gap is the baseline share minus the current share. The baseline is a reference, not a target.

Same numerator, smaller share.

$$4 / 100 = 4\% \quad | \quad 4 / 200 = 2\%$$

Illustrative units: unchanged numerator, doubled denominator. The example does not establish an observed cause.

THE FULL SAMPLE / PRIMARY CORPUS

# The whole timeline, in view.

January 2021 - May 2026. Monthly weighted visibility and inflation.  
Separate scales; observed series, not fitted trends.

Weighted visibility relates institutional prominence and potential reach to the inflation corpus. Potential reach is not observed readership or understanding.

01 / VISIBILITY TREND

-0.076  
pp per month

April 2024 - May 2026

Controlled share trend: 95% interval -0.118 to -0.035 pp per month (25 months). Common sources also give a negative trend: -0.056 pp per month. This is a result for the stated period.

02 / NETWORK POSITION

Direction  
uncertain

April 2024 - May 2026

The common-source centrality trend is -0.0051 index units per month. Its 95% interval (-0.0129 to 0.0027) includes zero. Lasting network decline is not established. Centrality is not trust.

03 / EXPECTATIONS

No stable  
predictive link

January 2021 - May 2026

Article-share projections: no significant future horizons with linear weekly assignment; weeks 1-2 with step assignment; month 12 in monthly data, after correction. Controls also matter. Understanding and anchoring are not established by this pattern.

PUBLICATION

REPRESENTATION

UNDERSTANDING

For HNB: read publication activity, media representation and audience understanding together. This study measures representation; it complements communication records and audience research.

Scope: selected media corpus, not a representative audience sample. Generic references can include the ECB. Earlier-paper numerical discrepancies remain unresolved.  
Sources: Sections 4.2-4.7; Appendices A12, A23, B2.
